

Project Proposal - Job Application Portal

A. Scope (Problem)

Our app targets job applicants and administrators. Current hiring systems often lack secure, centralized ways to collect and manage applications, leading to data loss, poor organization, and security risks.

Included:

- Application submission system
- Admin dashboard for reviewing applications
- Secure login system

Not Included:

- Real-time chat
- Advanced analytics or external integrations

B. Objectives (Solution)

Our app provides a secure, role-based system for application management.

Main Features:

- User application form & contact form
- Admin dashboard with user management
- REST API for core operations

Key Security Features:

- JWT authentication & role-based access
- Input validation and password hashing
- Logging of logins, submissions, admin actions
- Rate limiting and security headers

Required Modules: login, search, upload, APIs, admin panel

C. Plan (Stages)

1. **Requirements & DB Design:** Define scope, design PostgreSQL schema
2. **UI Prototype & API:** Build frontend pages, backend endpoints
3. **Auth & Role-Based Access:** Implement JWT login, admin access
4. **Upload, Validation & Logging:** Resume upload, validation, logging
5. **Threat Modeling & OWASP:** Identify vulnerabilities, map to OWASP Top 10
6. **Testing & Finalization:** Test, fix bugs, secure, prepare demo
